3D Paper Canvas

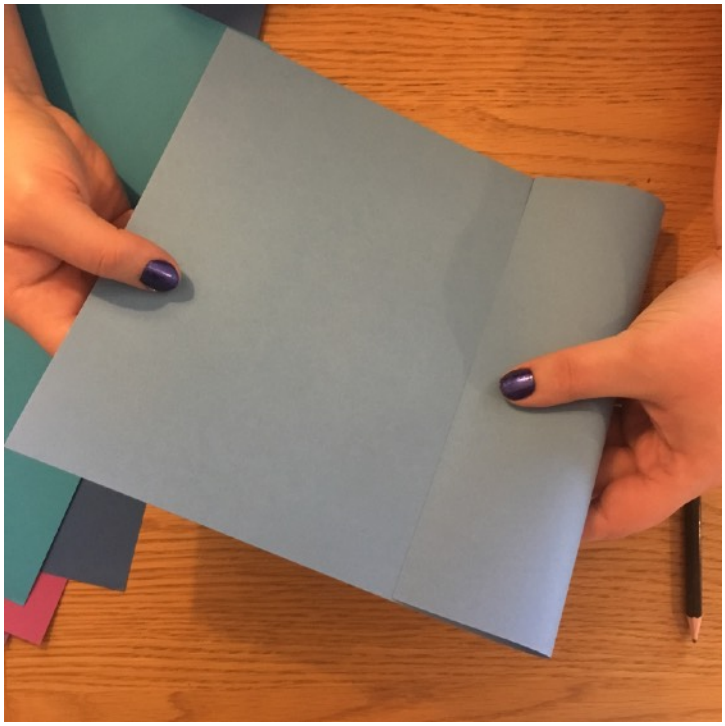

This is a really effective way to create a tactile and textured canvas easily at home!

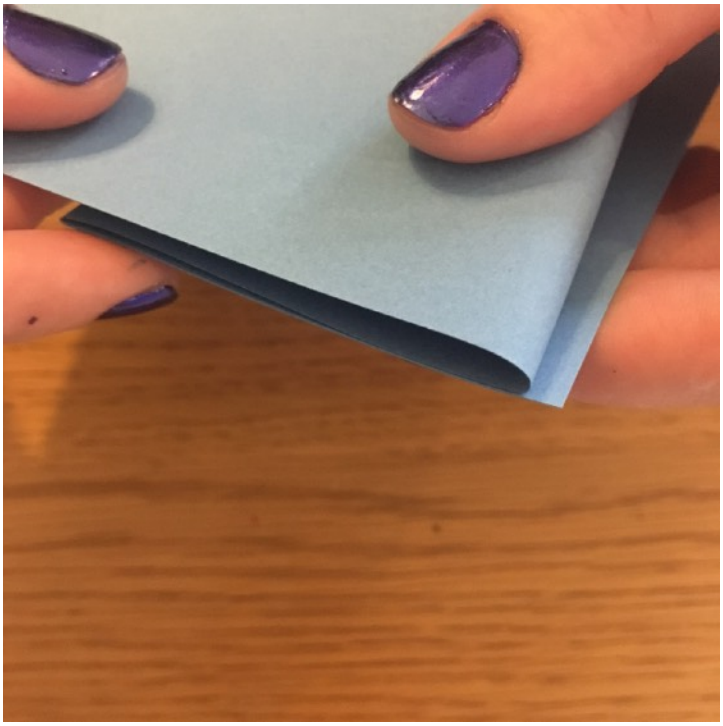

Tools and Materials:

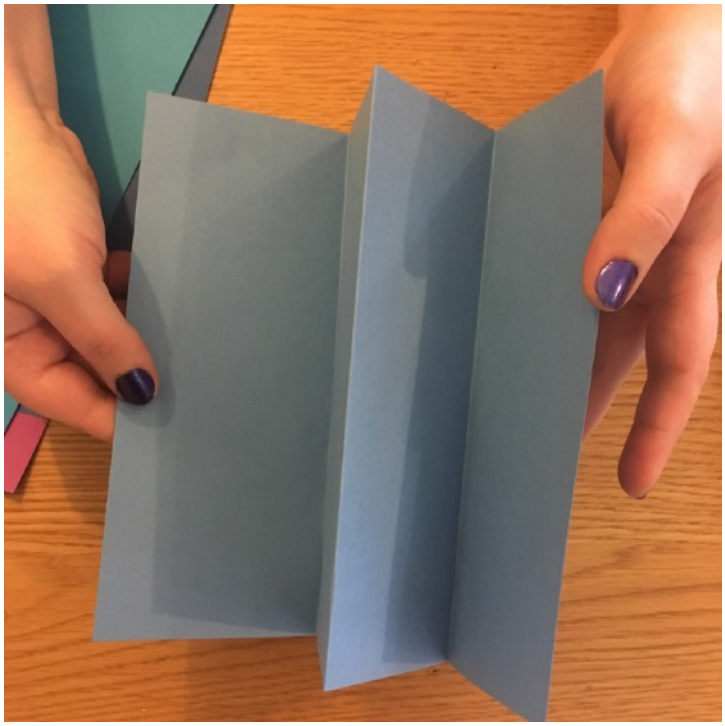

- Coloured Paper
- Pencil
- Liquid Glue
- Scissors
- Canvas

The way this works best is using the same shape repeated to make a bigger image - geometric shapes work well such as hearts. You can use the same shape in different colours - you can also fold the paper so you can cut out more at once which is a handy tip! We folded ours into 5 bits

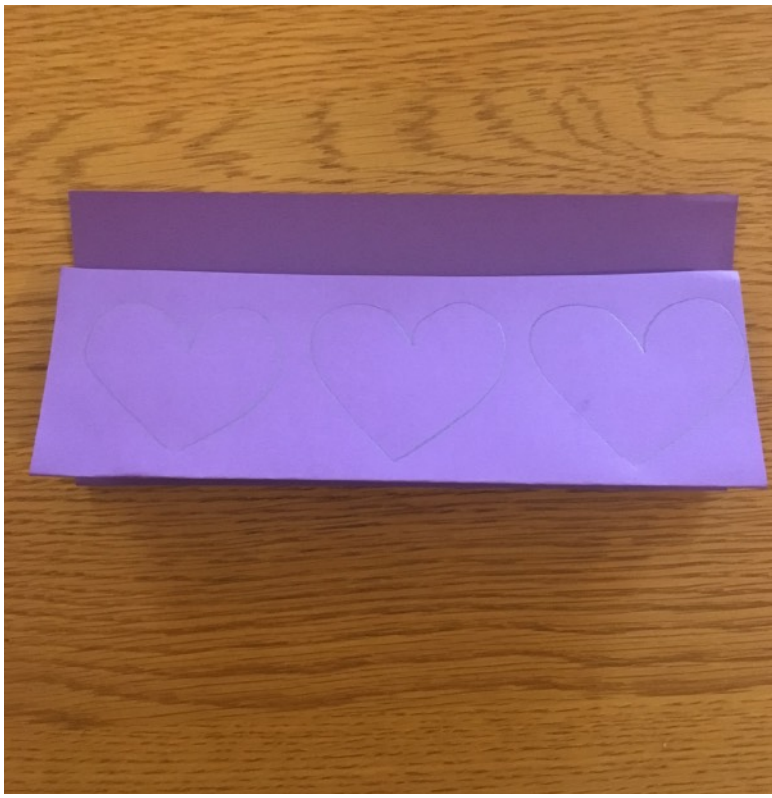

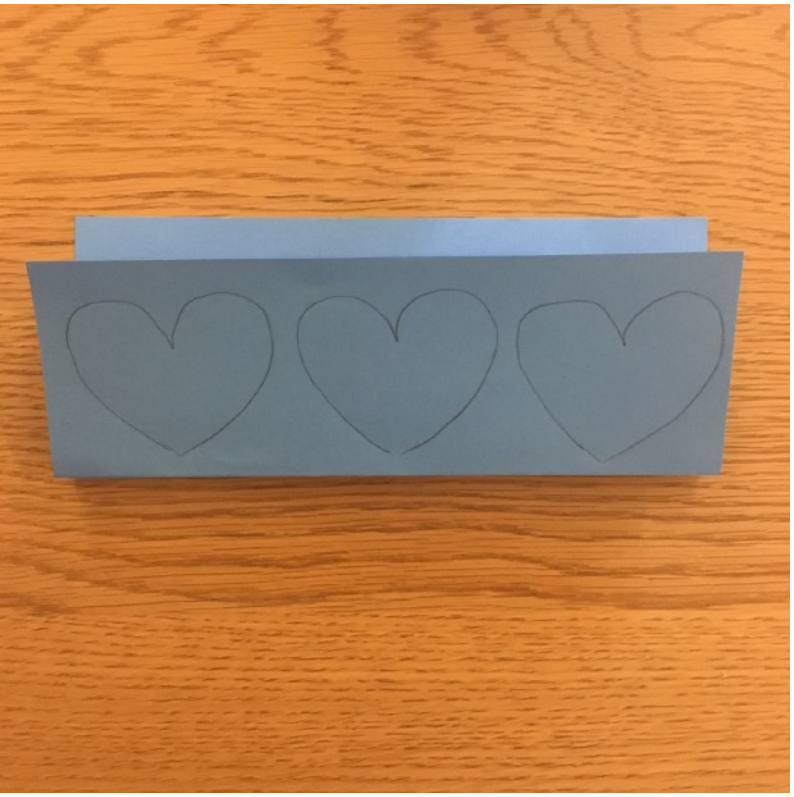

Taking your folded bits of paper you can start to draw your shapes - we chose hearts for this one

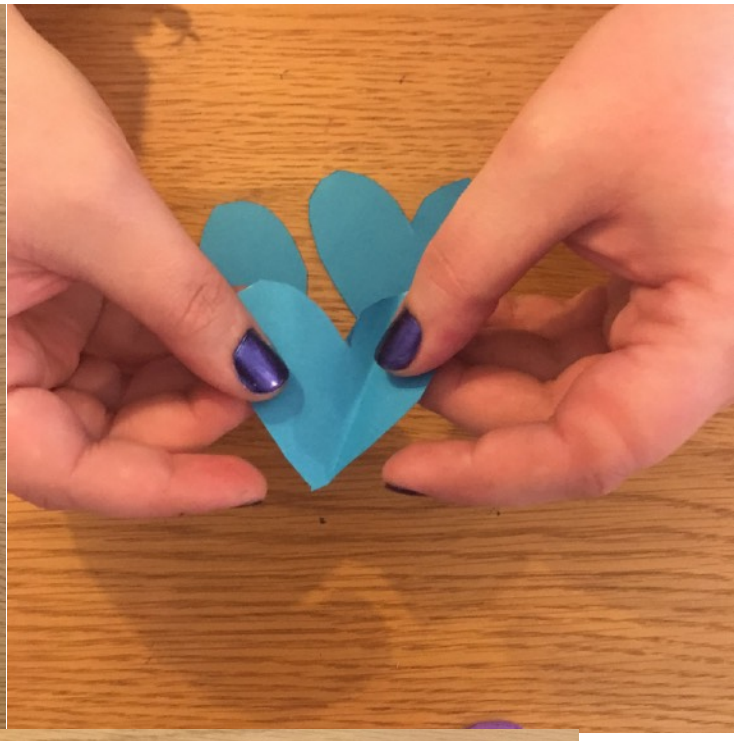

When happy with them cut them all out and then fold them - we fold them twice just off centre to have a ridge along the bottom - almost like a butterfly with a body in the middle

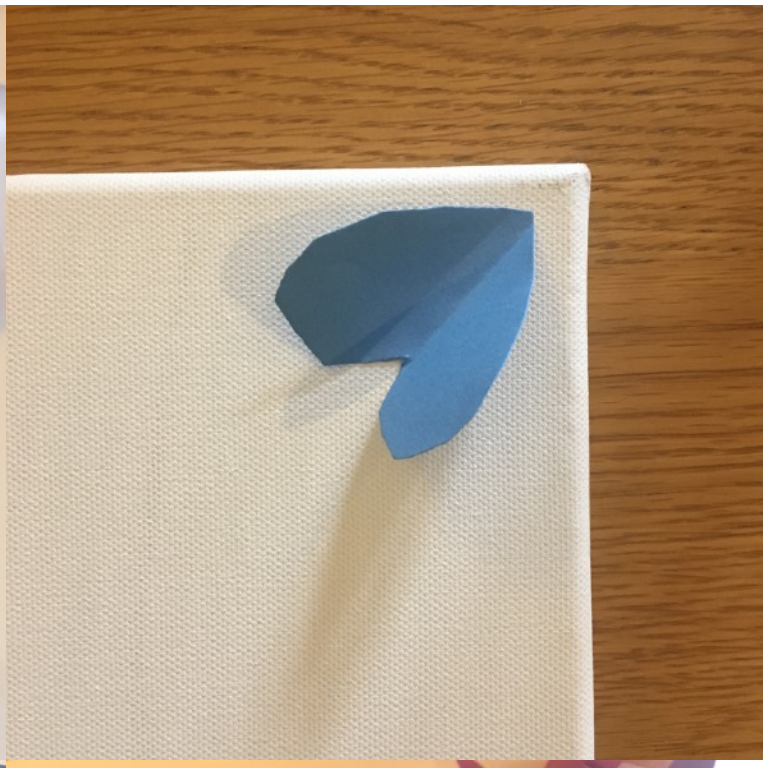

Now you can start to glue your shapes to your canvas - think about the colour and position of what you want to create - is it another shape or word or does it focus on colour alone?

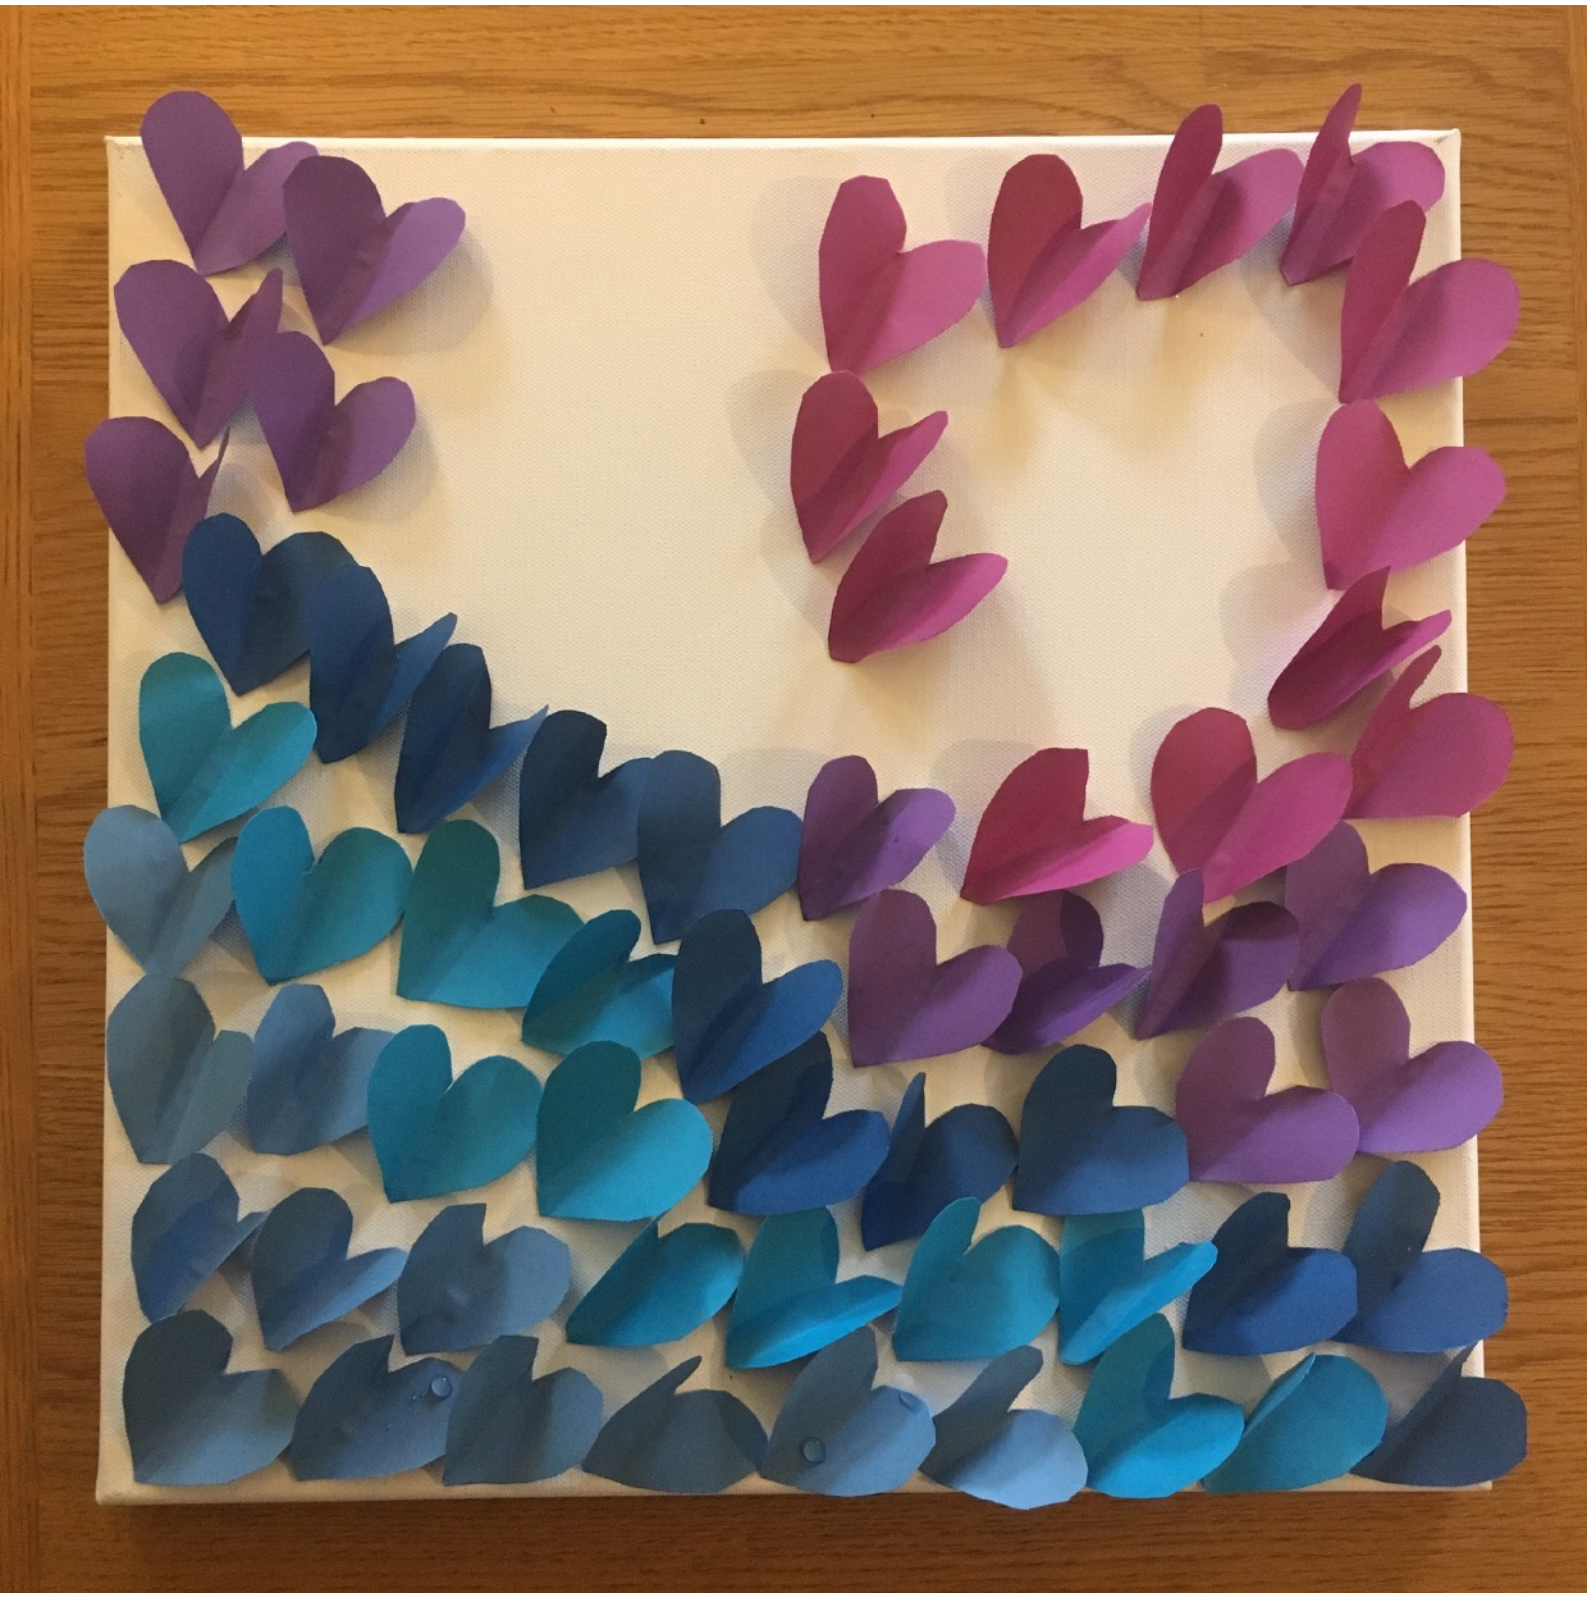

And there you have it your own 3D Paper Canvas!

Here is another we created to inspire you!
