Vanishing Point

Another way to look at perspective and explore vanishing points is creating this 3D starburst effect of squares!

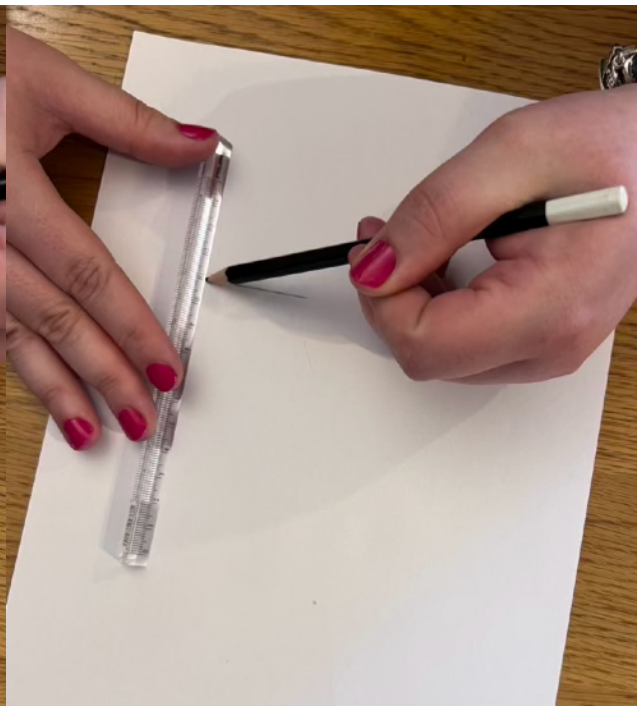

Tools and Materials:

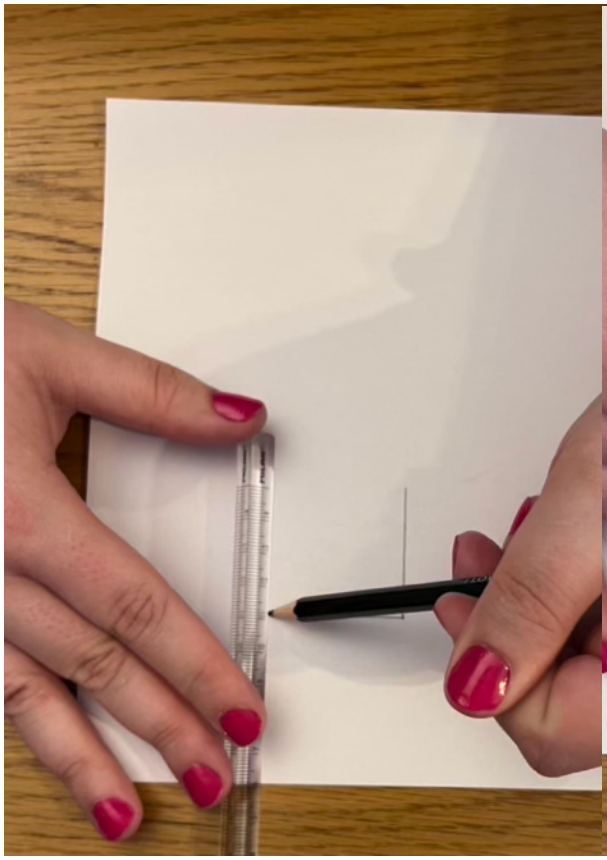

- Paper
- Pencil
- Ruler

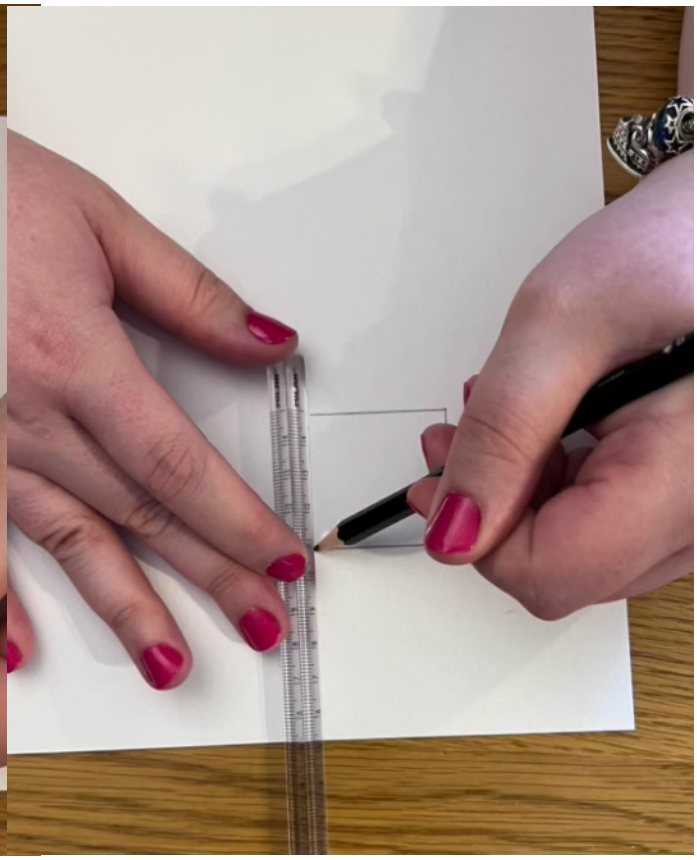

Start off by drawing a square with your ruler like so

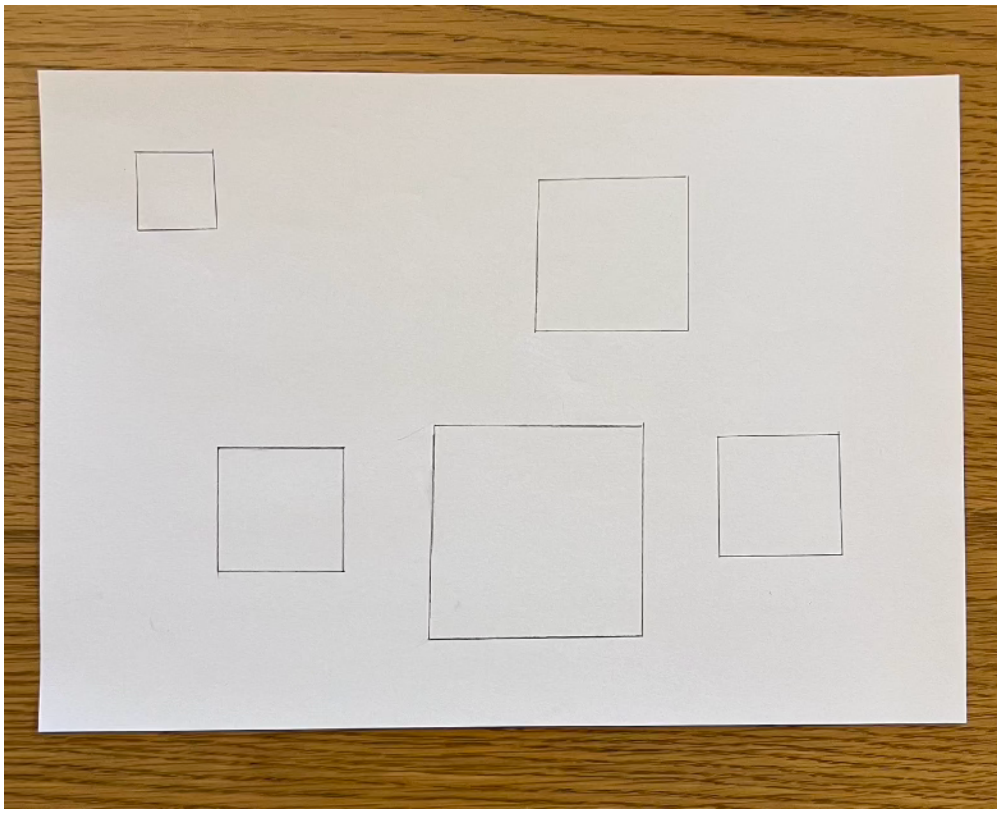

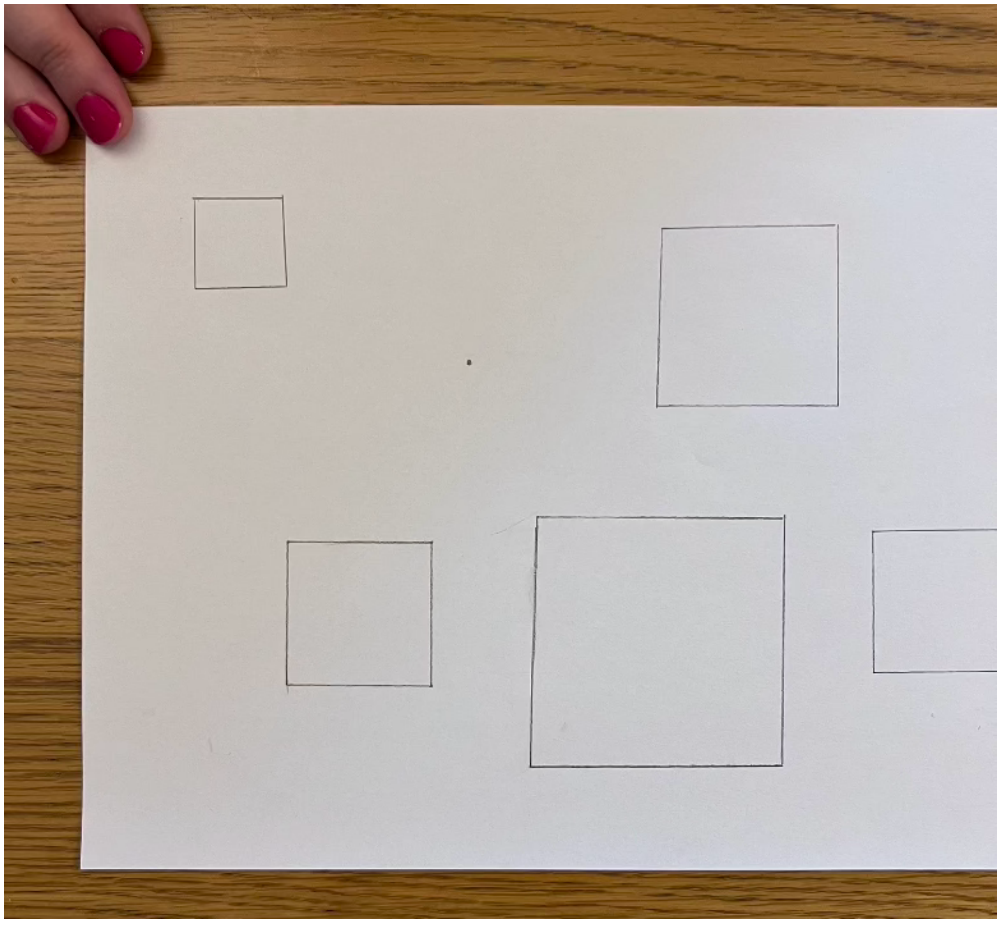

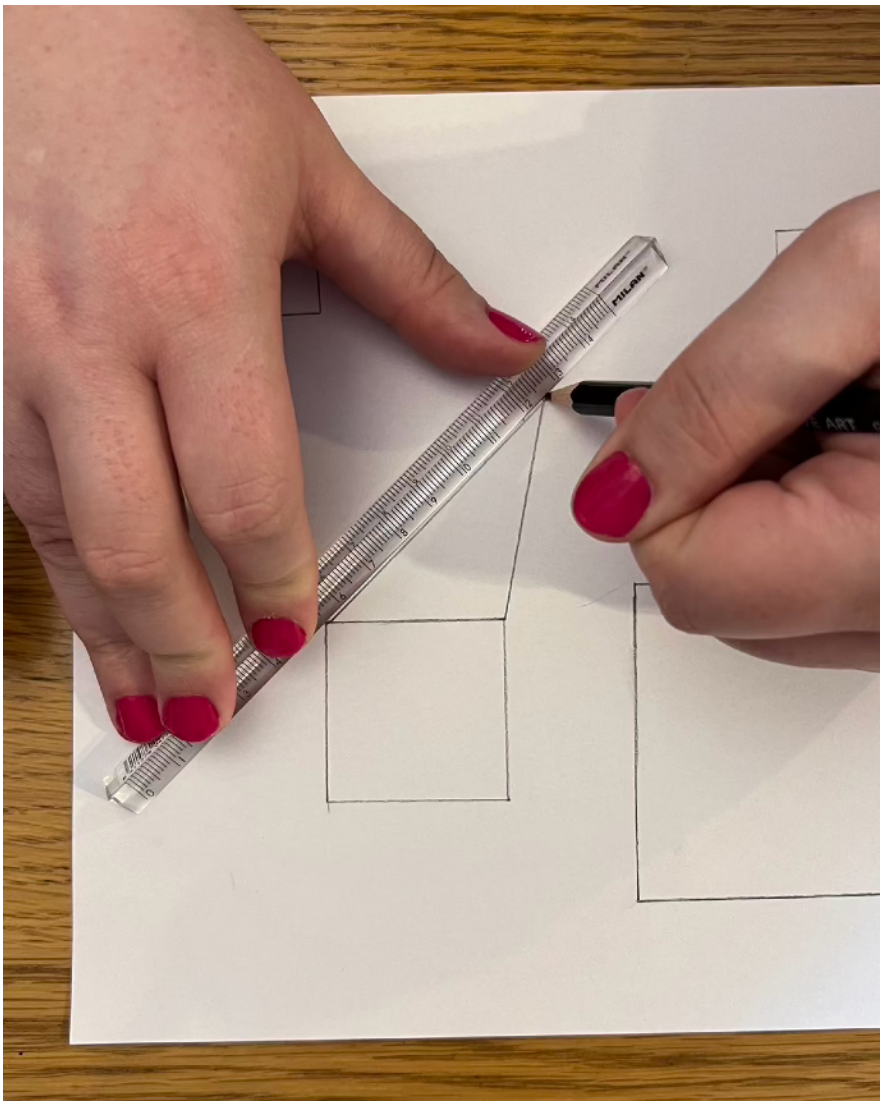

Once you have done one square then add some more squares around like so

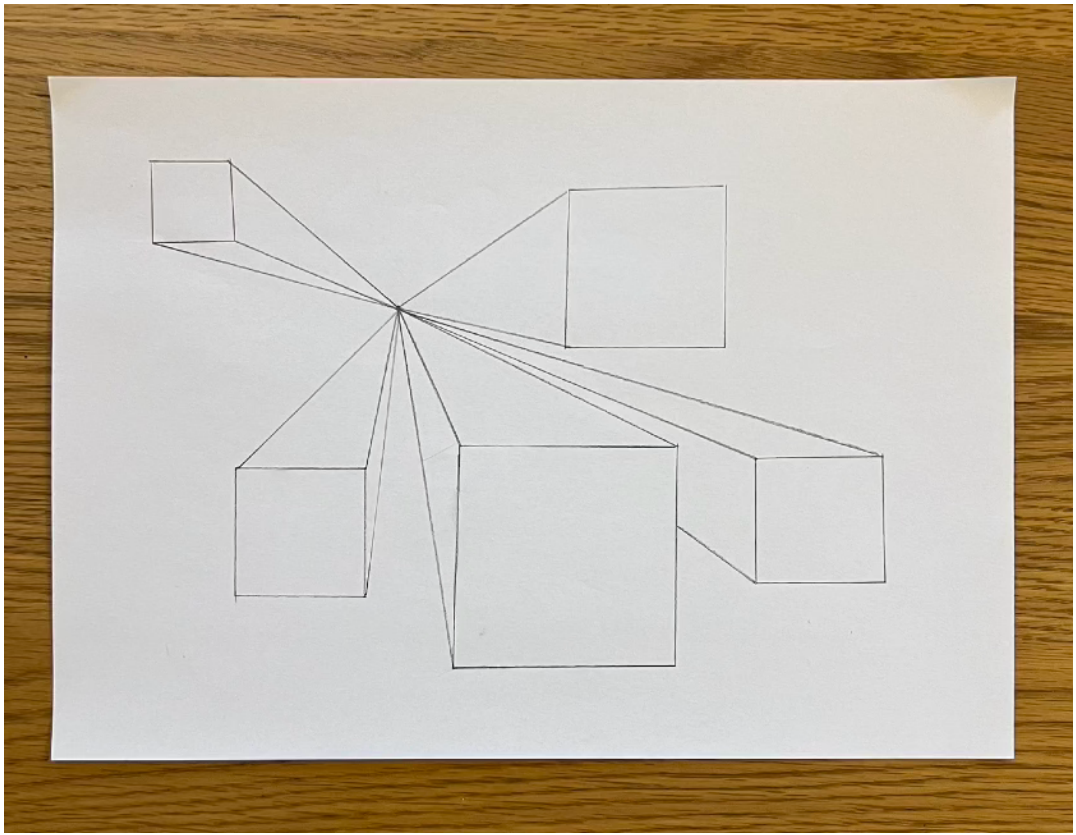

Choose where you want the focal/vanishing point to be draw a dot to mark it

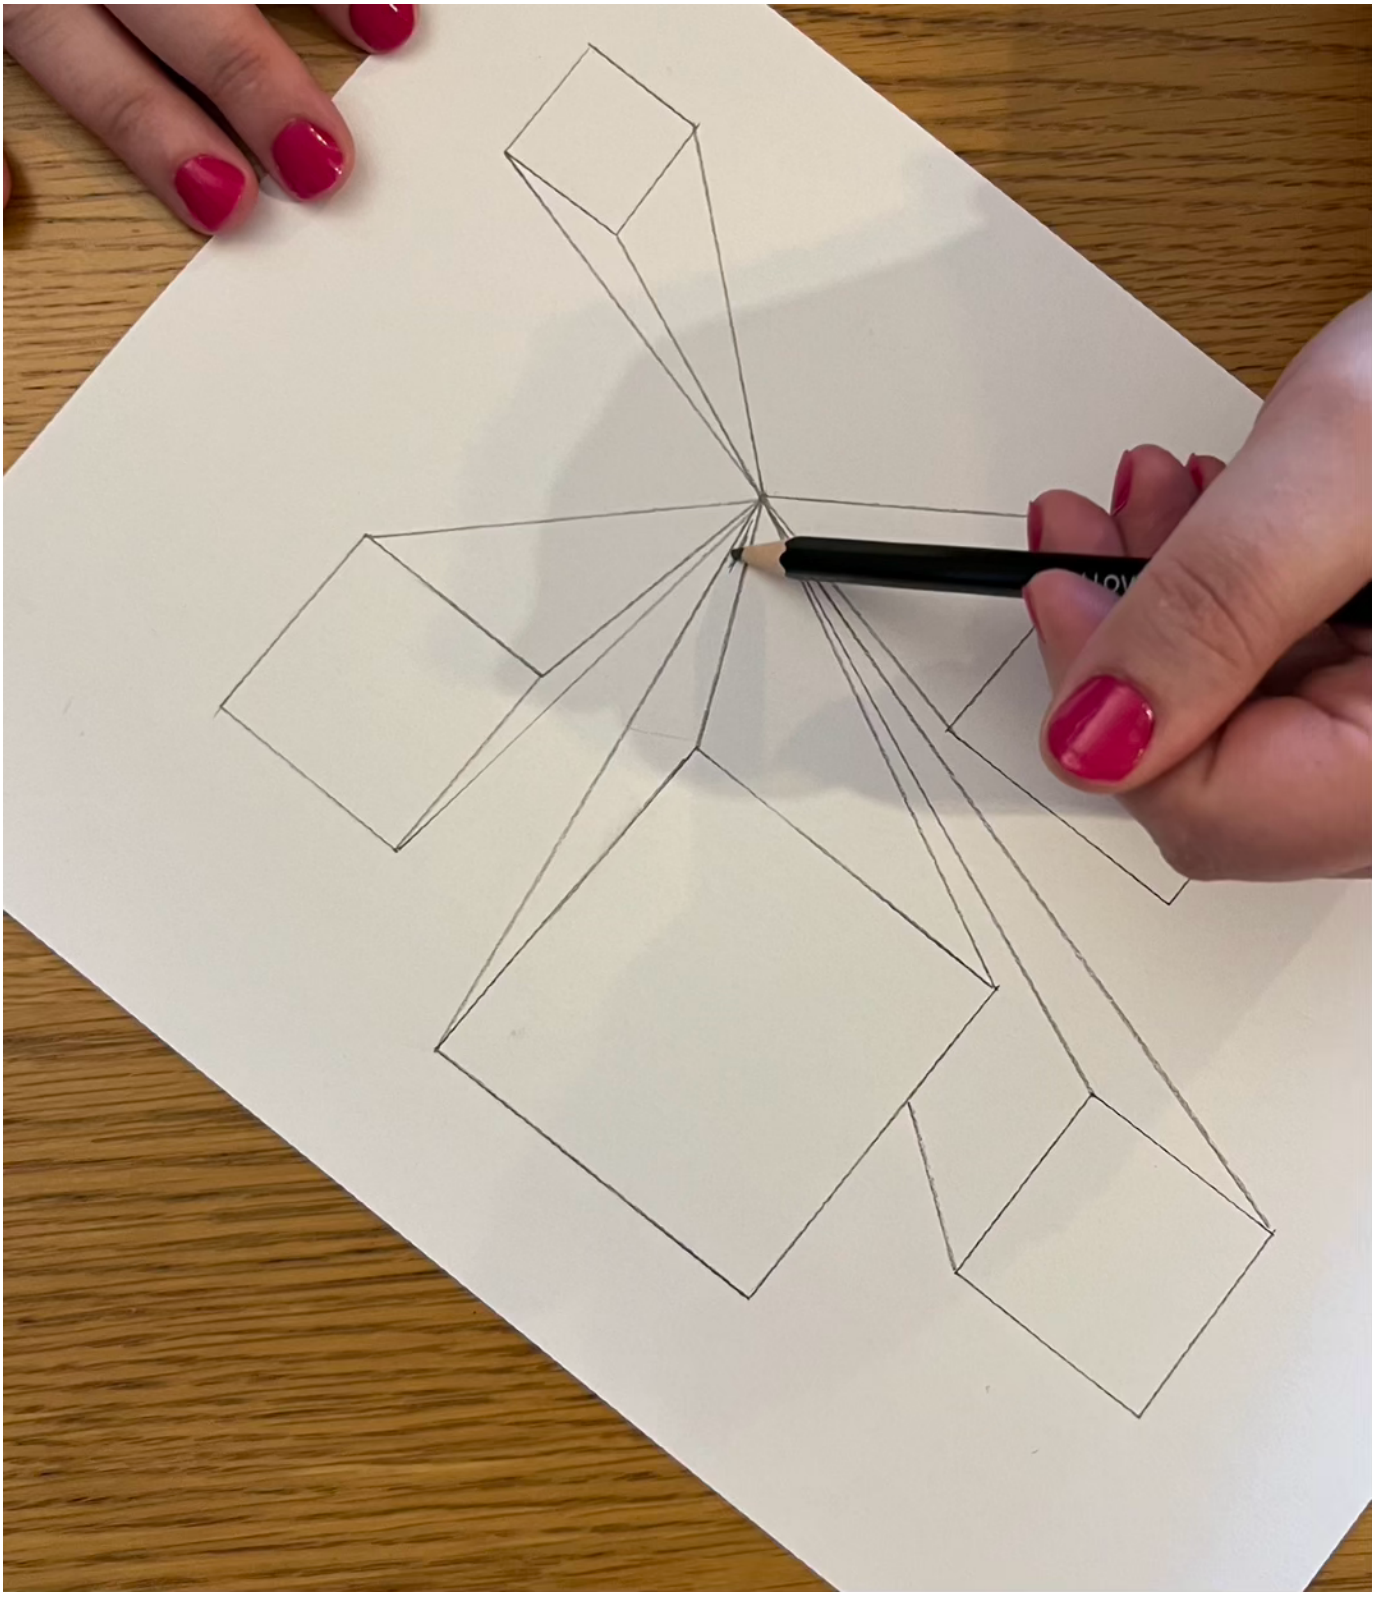

Take the ruler and from every corner where a line could be visible draw it towards your vanishing point like so

Once you have drawn all the lines needed to connect you can start shading it to give it depth - the flat squares one colour, the side panels another colour and the tops or undersides another colour. Keeping it uniform gives an idea of where the light is coming from and balance

There you have it your very own “Vanishing Point” drawing!
